## **Abstract**

---

## **Introduction to single cell and imaging multi-omics**

---

Testing github pages.

## **Current multi-omic technologies**

---

## **Challenges for interpretation**

---

Need for technology-specific questions and analysis methods vs one size fits all data blender

## **Case studies**

---

### **scNMT-seq as a case-study for epigenetic regulation**

#### **Overview and biological question**

#### **Computational challenges**

- Identification of multi-omics signatures that characterise lineage, stage or both.
- Handling missing values
- Do epigenetic changes in some genomic contexts affect cell fate decision more than others? If so, how?

#### **Methods for stats/maths analyses and results summary**

### **scRNA-seq + FISH as a case study for spatial transcriptomics**

#### **Overview and biological question**

#### **Computational challenges**

- Can scRNA-seq data be overlaid onto seqFISH for resolution enhancement
- What is the minimal number of genes needed for data integration?
- Are there signatures of cellular co-localization or spatial coordinates in the non-spatial scRNA-seq data?

#### **Methods for stats/maths analyses and results summary**

### **Spatial proteomics and cross-study analysis**

#### **Overview and biological question**

#### **Computational challenges**

- Integrating partially-overlapping proteomic data collected on different patients with similar phenotypes
- Integration of spatial x-y coordinate co-location and co-expression
- Integration with other 'omics datasets (e.g., scRNA-seq) to support the results of these proteomic analyses
- Can we predict the spatial expression patterns of proteins measured on mass-tag but not measured in the MIBI-TOF data?

- What additional information can we learn about the different macrophage and immune populations in breast cancer by conducting integrated analyses of these datasets?

## **Methods for stats/maths analyses and results summary**

## **Overview of common analytical methods spanning technologies / case studies**

---

- matrix factorization
- neural network / autoencoders

## **Data structures and software packages to enable analyses**

---

- Bioc/multiAssayExperiment for single cell
- new classes for proteomics
- PyTorch

## **Techniques and challenges for benchmarking methods**

---

- realistic simulation studies
- cross-study validation
- benchmark datasets

## **Discussion**

---

### **Emerging analytical methods and technologies**

### **Community needs for data structures, analysis methods, etc**
